

Assessment 1

Set A

1. Verify the installation of Python and pip on the CentOS system. Create a virtual environment named **venv**, activate it, and install the Flask framework.
2. Create a project folder named **FlaskPractical1**, create an **app.py** file, write a Flask program to display "**Hello Flask**", and execute the application. Open the application in a web browser and verify the output at <http://127.0.0.1:5000>

Set B

1. Create an application that displays the message "**Welcome to Student Portal**" on the home page. Execute the application in debug mode and verify the output in the browser.
2. Create a Flask application that returns "**Welcome to E-Commerce Website**" when accessed through the browser. Execute and verify the output.

0: Not Done		1: Incomplete		2:Late Complete	
3: Needs Improvement		4: Complete		5: Well Done	

Assessment 2

Set A

1. Create a Flask application with the following routes:
 - /
 - /about
 - /contactDisplay appropriate messages for each route.
2. Create a dynamic URL route:
 - /student/<name>displays the student's name entered in the URL. Execute the application, test the route using the browser with different values, and verify the displayed output

Set B

1. **Create a dynamic URL route:**
 - /product/<product_name>/<int:price>/<category>Display the product name, price, and category. test the route using the browser with different values.
2. Create a dynamic URL route:
 - /employee/<int:emp_id>/<name>/<department>Display the complete employee profile in a structured format. Run the application and verify the route output with different input values.

Set C

1. **Create a dynamic URL route:**
 - /order/<customer>/<product>/<int:quantity>/<int:price>Display the complete order summary in a proper format. Calculate the total order amount (Total Amount = quantity × Price) and display the result. test the route using the browser with different values.
